SYSTEM AND METHOD FOR IDENTIFYING A PARTICIPANT
DURING A CONFERENCE CALL

ABSTRACT OF THE DISCLOSURE

A system and method for identifying a participant during a conference call include the capability to receive a packet containing data that represents audible sounds spoken by one of a plurality of participants in a conference call and to

5   determine a speaker of the audible sounds using voice profile information of the participants. The system and method further include the capability to provide identification information of the speaker to the other participants in the conference call contemporaneously with providing audible sounds based on the data to those participants.
